

## Smart City Planning and Heritage – An IoT based toolkit framework

*The aim of this paper is to review and assess national and international developments in smart cities and their contribution in preserving the cultural heritage, thus facilitating the policy makers to embrace the concept of Smart Heritage. Smart city planning majorly focuses on IoT, ICT, big data, real time data and monitoring. This gives an opportunity to the policy makers to adopt the dynamic concept of IoT for heritage and integrate past and future through policy intervention, while managing the challenges faced by heritage and minimizing or negating the damage or decay of heritage assets of a city. The focus of this paper is upon integration of Smart Heritage in Smart City embracing a bottom-up approach from local level to national level. The objective encompassed herein is to explore the use of IoT in providing End-to-End (E2E) Solution using various smart tools, in a form of standard toolkit, which could be modified on a case by case basis. This toolkit will help enabling the capabilities of local bodies in monitoring and maintenance of heritage assets, thus assisting them to incorporate the smart heritage concept as a part of smart city planning.*

**Keywords:** Smart City, Smart Heritage, IoT, Policy intervention

### Introduction

There are several definitions of a “smart city” across the globe, either community/citizen-focused or data driven, based on the context and level of development along with willingness and aspiration of government and community.

Some of the broadly used definitions and approach are as below:

The British Standards Institute (BSI) defines the term as “the effective integration of physical, digital and human systems in the built environment to deliver sustainable, prosperous and inclusive future for its citizens”.<sup>1</sup>

IBM defines a smart city as “one that makes optimal use of all the interconnected information available today to better understand and control its operations and optimize the use of limited resources”.<sup>2</sup>

In the approach of the Smart Cities Mission in India, the objective is to promote cities that provide core infrastructure and give a decent quality of life to its citizens, a clean and sustainable environment and application of ‘Smart’ Solutions.<sup>3</sup>

---

<sup>1</sup>BSI (2014), *Smart cities framework – Guide to establishing strategies for smart cities and communities*, PAS 181:2014

<sup>2</sup>Cosgrove M & al, (2011), Smart Cities series: introducing the IBM city operations and management solutions. IBM.

<sup>3</sup>Official website of Ministry of Housing and Urban Affairs, Govt. of India, available on <http://mohua.gov.in/cms/smart-cities.php>

1 Cisco defines smart cities as those who adopt “scalable solutions that take  
2 advantage of information and communications technology (ICT) to increase  
3 efficiencies, reduce costs, and enhance quality of life”.<sup>4</sup>

4 According to the Manchester Digital Development agency, “a ‘smart city’  
5 means ‘smart citizens’ – where citizens have all the information they need to  
6 make informed choices about their lifestyle, work and travel options”.<sup>5</sup>

7 Cultural heritage is the combination of tangible and intangible assets,  
8 which hold cultural, artistic or architectural significance that include  
9 monuments, artistic expressions, landscapes, and even traditions, languages,  
10 and dances (UNESCO, 1972). Safeguarding of the urban heritage and  
11 landscapes is not only a need but also a necessary financial investment to  
12 progress towards the creation of inclusive and sustainable cities as they are  
13 crucial resources for sustainable development, economic growth and  
14 employment (Fusco Girard, L. 2013 and Girard et al. 2017). Also, the  
15 deterioration or destruction of artworks is a serious loss/damage that cannot be  
16 recovered in many cases (Fernando et al. 2017).

17 The paper attempts to explore the possibilities of use of IoT, ICT, big data,  
18 real time data and monitoring for managing the challenges faced by heritage  
19 and minimizing or negating the damage or decay of heritage assets of a city.  
20 This gives an approach and a system to provide End-to-End (E2E) Solution  
21 using various smart tools, in a form of standard toolkit, which could be  
22 modified on a case by case basis. This toolkit will help enabling the capabilities  
23 of local bodies in monitoring and maintenance of heritage assets, thus assisting  
24 them to incorporate the smart heritage concept as a part of smart city planning.

25 The structure of the paper is as follows: first, the concept of ‘Smart  
26 Heritage’; second, various systems, techniques, tools discussed together with  
27 the approach needed to assess, maintain and monitor the value of heritage;  
28 third, an elementary suggestive toolkit for heritage management within the  
29 context of smart cities.

### 31 **Smart Cultural Heritage**

32 The concept of “smart cultural heritage,” according to researchers of the  
33 EU funded DATABENC (Distretto ad Alta Tecnologia per i Beni Culturali)  
34 initiative, is about digitally connecting institutions, visitors, and objects in  
35 dialogue. Smart heritage focuses on adopting more participatory and  
36 collaborative approaches, making cultural data freely available (open), and  
37 consequently increasing the opportunities for interpretation, digital curation,  
38 and innovation. This offers potential and unprecedented access to cultural  
39 artefacts and experiences across distances, in which cultural consumers are no  
40 longer passive recipients (Angelaccio, M. et al. 2012).  
41  
42

<sup>4</sup>Falconer G & Mitchell Sh (2012), Smart City Framework A Systematic Process for Enabling Smart+Connected Communities

<sup>5</sup>MDDA website <http://www.manchesterdda.com/smartycity/>

1 In 2014, at the International Biennial of Art Restoration and Heritage  
2 Management (AR&PA) in Valladolid, Spain on the theme of ‘India-Spain Co-  
3 operation in the field of Heritage Conservation and Management’, a roundtable  
4 was organised on the future of heritage in the context of Smart City (MEA  
5 Report 2014).

6 The Internet of Things (Zanella et al. 2012) is changing our life style and  
7 our connection with the world. The recent development in technologies may  
8 influence the development of a new framework adept to support heritage-led  
9 policymaking in smart cities, as *smart heritage* agenda. Information  
10 technologies can be helpful in promoting inclusive, comprehensive and  
11 participative governance to support heritage centred sustainable urban  
12 development and economic growth.

### 13 14 15 **Methodology/Research Design**

16  
17 The methodology adopted for this paper is ‘cross-case analysis’, whereby  
18 selected information is collected across selected cases and then analysed  
19 comparatively in order to identify underlying trends, patterns and relationships,  
20 allowing for the extraction of theoretical propositions (Eisenhardt, K., 1989). In  
21 this paper, the author has examined several systems, techniques and tools to  
22 understand how the cultural heritage of cities has been incorporated in existing  
23 smart city strategies so far. Thus, proposing an elementary suggestive toolkit,  
24 for monitoring and maintenance of heritage assets, which could be modified on  
25 a case by case basis.

### 26 27 28 **Valuation of Heritage**

29  
30 The preservation of cultural heritage implies a valuation process.  
31 Labelling something as heritage constitutes a value judgment, distinguishing a  
32 specific object/event from others; it is a conscious act of belonging to a group,  
33 a city, a nation and the outcome of an important cultural journey (Riganti, P.  
34 2010). A property as having Outstanding Universal Value should fulfil the  
35 criteria of Operational Guidelines for the Implementation of the World  
36 Heritage Convention. These criteria were formerly presented as two separate  
37 sets of criteria - criteria (i) - (vi) for cultural heritage and (i) - (iv) for natural  
38 heritage. The 6th extraordinary session of the World Heritage Committee  
39 decided to merge the ten criteria (Decision 6 EXT.COM 5.1). Protection and  
40 management of World Heritage properties should ensure that their Outstanding  
41 Universal Value, including the conditions of integrity and/or authenticity at the  
42 time of inscription, are sustained or enhanced over time (UNESCO 2017).

43 The bottom-up approach emphasises the use of new technologies (for  
44 example, social media, websites, mobile applications or censoring technologies)  
45 and new data (becoming available through open data platforms or sensors) as a

1 means to enable citizens to devise solutions, acquire new skills through online  
2 learning and improve their interaction with decision makers.

### 3 4 5 **ICT/IoT for Smart Cities and Smart Heritage**

6  
7 There are couple of applications, which have been developed for smart  
8 cities through Information and Communication Technologies (ICT). These  
9 have been categorised as per application type. Some of them are Smart  
10 lighting, Smart parking, Smart buildings, Energy consumption, Traffic control,  
11 Centralized and integrated system control, Structural health of buildings.

#### 12 13 *General Architecture of IoT*

14  
15 General architecture of IoT that interconnects data and information  
16 through devices and internet involves various elements creating a cycle of  
17 information flow. These are: (i) User, (ii) Devices, (iii) Technologies, (iv)  
18 Storage, (v) Processing and Classification, (vi) Applications' sectors

19 ICT/IoT can serve dual purpose, one for the users (i.e. visitors/ tourists)  
20 and second for the decision makers (i.e. government/ local bodies). Here, the  
21 role of big data comes into picture, which is very crucial as it has greater  
22 influence on administration and dissemination of information. Proper  
23 management of big data is utmost important as it generates value in  
24 information, in absence of that platforms lack of velocity to process data,  
25 coverage to hold great value of information, and ability of classification of data  
26 according to their variety (José, et al. 2016).

27 Vattano (2014) asserts that the integration of a city's historical elements  
28 into its modern reality is a significant factor towards the advancement of its  
29 urban intelligence. The specific benefits of including cultural heritage in a  
30 smart city initiative derive from big data management and augmented reality  
31 (AR).

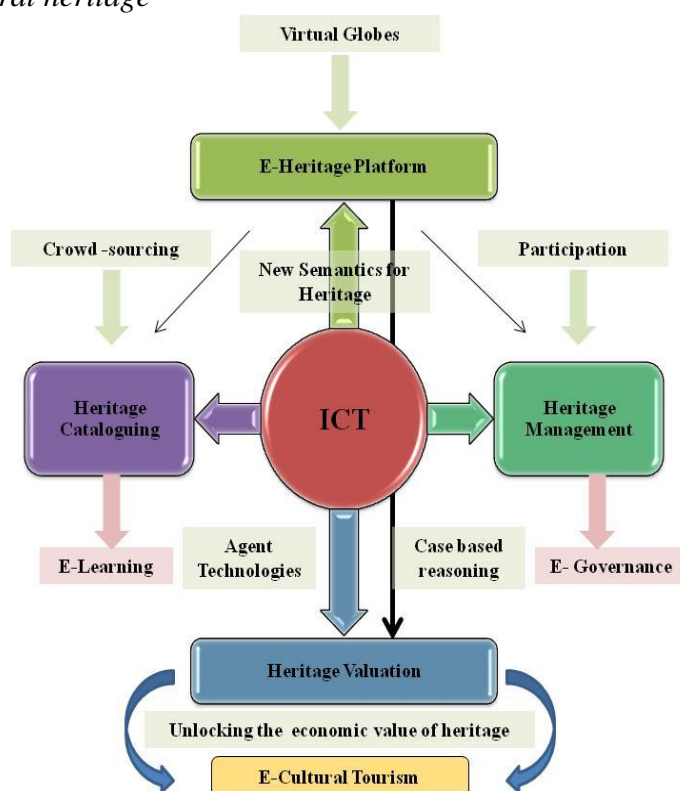

32 ICT can serve the users through various systems which comprise of state-  
33 of-art technologies. Some of them are as below:

34  
35 Enabling Technologies: Internet of Things (IoT), Cloud computing, Wireless  
36 Sensor Network (WSN), Wireless Sensor Network (WSN), Short range wireless  
37 Visualisation Technologies: 3D visualization, Geovisualisation, Augmented  
38 Reality (AR)

39  
40 For decision makers, an integrated platform is required, which should have  
41 the potential to combine the demand-supply assessment of heritage assets with  
42 the management strategies, hence providing a national and regional database  
43 for the preservation and management of heritage. A system which incorporates  
44 multimodal data analysis, and content-based augmented data retrieval with the  
45 aim of assisting preservation endeavours. This integrated platform has three  
46 main components: an ICT architecture, based on the use of advanced information  
47 techniques such as agent technologies; which would be linked to a 3D GIS

1 relational database/virtual globe containing all the relevant information on the  
 2 site and its cultural heritage. Finally, the combination of these two components  
 3 would be supplemented by a number of users driven software/apps, providing  
 4 e-services to enhance the access and appreciation of cultural destinations and  
 5 their heritage, as well as software for online valuation of public preferences for  
 6 the way such heritage is presented/managed/used (see Figure 1). The final  
 7 product should be flexible to accommodate future improvements (Riganti, P.,  
 8 2017)

9

 11 *cultural heritage*

12  
 13 *Source: adapted from Riganti, 2017*

### 14 15 16 **Proposed elementary suggestive toolkit for Smart Heritage**

17  
 18 The proposed elementary suggestive toolkit will form a system which will  
 19 utilise contemporary tools in natural language processing, image processing,  
 20 semantic classification and dissemination.

21 It will work under three major categories:

22  
 23 **Research:** identify the ways for improved use of spatial and physical analysis to  
 24 further identify risks and opportunities; improving knowledge and awareness  
 25 towards digital archiving and dissemination.

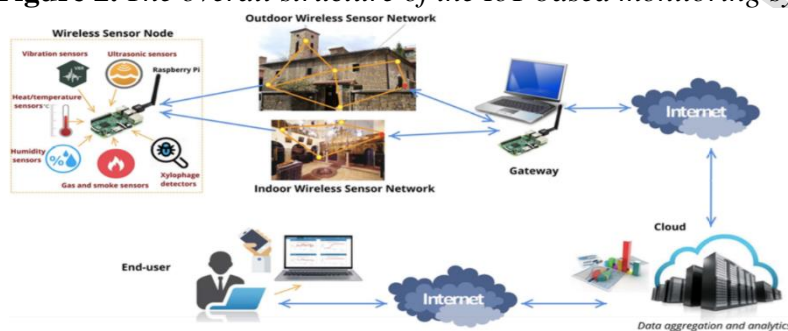

26 **Engagement:** showcasing the value of heritage with assumptions and counter-  
 27 assumptions; transfer and sharing of sensitive heritage data; citizen engagement

1 through social awareness of impacts of heritage on society as they are vital for  
 2 sustainable development, economic growth and employment.  
 3 Presentation/Promotion: improving data sharing capability; identifying type of  
 4 metadata which is more accessible.

### 5 6 *Components of Toolkit*

7  
8 The proposed approach enables 24/7 monitoring of a variety of  
 9 parameters, generates accurate and specific alerts, hence enabling real-time  
 10 insights into heritage conditions and timely interventions. This solution is  
 11 modular and can be tailored to the specific use-case scenario by adding the  
 12 extra components and services (see Figure 2).

13  
14 **Figure 2.** *The overall structure of the IoT based monitoring system*

15  
16 *Source:* Marijana. 2019

17  
18 *General structure and main design principles using the six-layer IoT architecture*  
 19 (see Figure 3 and Figure 4)

20  
21 The Source Logic Layer: Lowest layer which consists of online and  
 22 offline data derived from various IoT devices such as sensors, and human and  
 23 social network. The raw data is sent to cloud infrastructure to be stored and  
 24 extracting the relevant data.

25 The Data Logic Layer: Contains functional modules to gather and process  
 26 the data collected from various sources (offline, human and social). Pre-  
 27 processed data are validated and elaborated using data validation, processing,  
 28 classification and enhancement techniques to produce useful information.

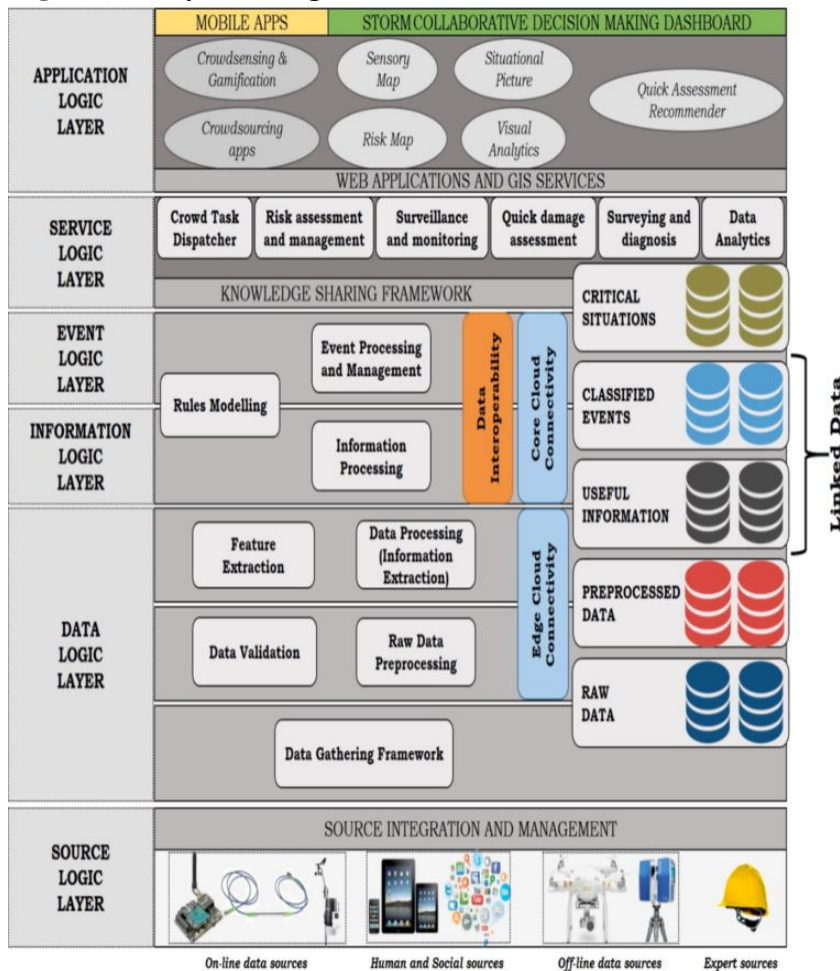

29 The Information Logic Layer: Information processing and fusion modules  
 30 dealing with the processing of useful information, produced by the data  
 31 analysis modules, to extract classified events.

32 The Event Logic Layer: Set of modules to analyse and process the  
 33 classified events, application of Complex Event Processing techniques,  
 34 elaborating the Threat analysis and Risk assessment for a valid Decision  
 35 Support Mechanism.

36 The Service Logic Layer: Contains various service categories to prevent,  
 37 manage and mitigate risk associated with the natural hazards in the cultural  
 38 heritage domain.

1        The Application Logic Layer: This layer allows users/experts to interact  
 2 with the services and tools using web applications technologies, mobile apps,  
 3 GIS services, crowdsourcing etc. In this layer, GUI functionalities are  
 4 implemented to have an easy and intuitive access using a simple browser to the  
 5 operational and collaborative working environment for making decisions and  
 6 sharing the cultural heritage knowledge.

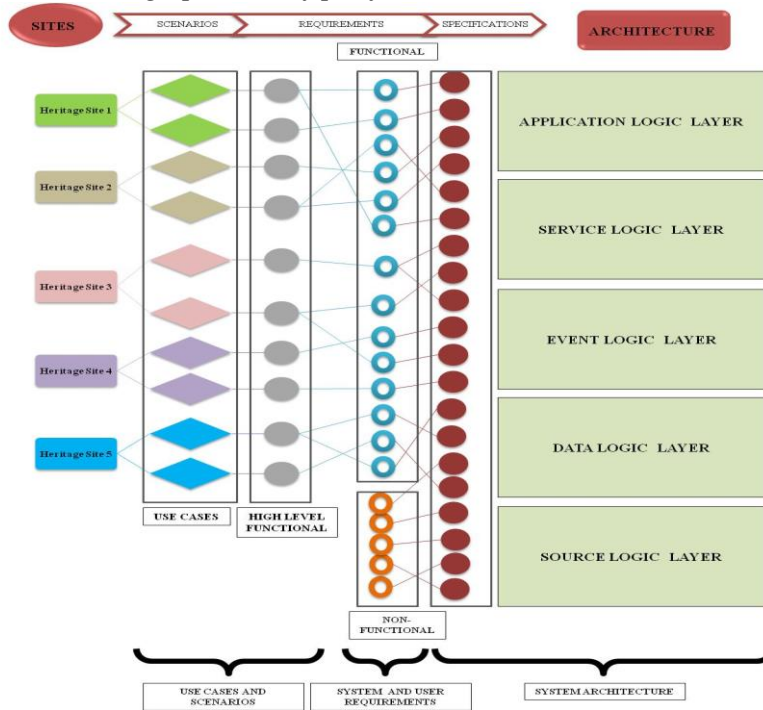

7

4  
5 Components of this suggestive toolkit should be modified on a case by  
6 case basis such as indoor and outdoor (building/ statue). (see Table 1)

7  
8 **Table 1. Components of the suggestive toolkit**

Design Component	Analysis/ Monitoring	Technique/ Tools	Dataset
Node	Surveillance and Monitoring	Electronic sensing techniques	Temperature, Humidity, Equilibrium
	Microclimatic monitoring	RFID (Radio Frequency Identification), Bluetooth, Wi-Fi	Moisture Content (EMC)
Gateway	Quick Damage assessment	Wireless sensor networks	measurement, Termite/pest detection
Cloud	Energy requirements evaluation	Web applications	
Infrastructure	Risk Assessment and Management	Mobile applications	HDFS and NoSQL databases
User Interface	Data Analysis	GIS	
		Crowdsourcing	

9  
10 The components of this toolkit be improved with further research and case  
11 studies.

12  
13

## 1 Conclusion

2  
3 A smart heritage agenda is a heritage management/ governance tool for  
4 smart cities. Prima-facie, such an agenda could consist of a policy framework, but  
5 eventually would need to be developed into a proper tool based on ICT intelligent  
6 environment to support policy making related to the various risks that heritage  
7 faces. An intelligent environment, based on an open data approach, would be an  
8 ideal support for policy makers. For the recognition of proposed concept, multiple  
9 options need to be explored amongst variety of available sensors, cleaning and  
10 processing methods for collected data, techniques for setting alerts, storing of the  
11 generated data and approaches of accessing the processed data, in order to select  
12 the appropriate contender for each of the application fields. IoT architecture can be  
13 optimized with focus on cost efficiency and energy efficient solutions.
