

# 1 **Students' Perceptions of Their Engagement in Statistics** 2 **Class Activities** 3

4 *This study investigates how students perceive their participation in statistics*  
5 *class activities. Effective pedagogical practices depend on knowing how students*  
6 *interact with data-related tasks. To gauge the self-reported levels of engagement,*  
7 *interest, and perceived relevance of Statistics activities, the study polls 433*  
8 *students in grade 12. To fully understand the perspectives of students, the study*  
9 *uses a quantitative strategy that includes quantitative surveys. The implications*  
10 *of this study add to the conversation about statistics education. The results guide*  
11 *the development of curricula, instructional strategies, and educational policies*  
12 *to encourage meaningful participation and enhance student outcomes in*  
13 *statistics. A generation that is data literate and capable of using data for*  
14 *informed decision-making is created by adapting teaching strategies to students'*  
15 *needs and interests. The needs and goals of the students can be used to improve*  
16 *statistics programs.*  
17  
18

## 19 **Introduction** 20

21 In today's information-driven era, the ability to make effective decisions is  
22 crucial for organizational performance and competition (Elgendy, Elragal &  
23 Päivärinta, 2022). Applied statisticians play a vital role in advising stakeholders  
24 across various fields, including medicine, finance, and education, with the  
25 objective of improving decision-making under conditions of uncertainty  
26 (Longford, 2021). Recognizing the growing importance of statistics skills,  
27 educational institutions have integrated statistics activities into their curricula.  
28 However, the success of these initiatives hinges upon the students' perceptions of  
29 their involvement. By gaining insights into how students perceive their  
30 engagement in statistics activities, valuable guidance can be obtained to enhance  
31 pedagogical approaches in this domain. This study aims to investigate students'  
32 perceptions of their engagement in Statistics Class activities, focusing on their  
33 levels of engagement, influencing factors, challenges faced, and suggestions for  
34 improvement.  
35  
36

## 37 **Problem Statement** 38

39 While statistics education has received much attention in recent years, there  
40 has been little study on high school students' perceptions of their participation in  
41 Statistics class activities. Understanding how students view their participation in  
42 these activities is critical for enhancing teaching tactics and the efficacy of  
43 statistics programs. There is a void in the research covering the elements that  
44 impact students' perspectives, the obstacles they face, and their ideas for improving  
45 their statistics learning experiences.  
46  
47

## **Purpose and Research Questions**

Investigating students' perceptions of their participation in class activities in statistics is the purpose of this study, which aims to close the gap that currently exists. The study's research questions included the following:

- How do students perceive their level of engagement in Statistics Class activities?
- What factors influence students' perceptions of their engagement in statistics activities?
- What challenges do students encounter while engaging in Statistics Class activities?
- What suggestions do students have for improving their learning experiences in Statistics?

The solutions to these issues can help teachers, curriculum developers, and policymakers enhance the teaching of statistics.

## **Literature Review**

To build the groundwork for future study, academics must synthesize previously published work (Watson & Webster, 2020). A literature review is research that synthesizes and analyses previously published material to advance ideas (Post, Sarala, Gatrell, and Prescott, 2020). All research initiatives and disciplines must take into account past, pertinent literature (Snyder, 2019). Here are the key components addressed in the literature review of this study:

### **Statistics at High School**

At its core, statistics is the study of mathematics, in which students work on collecting, processing, analysing, and drawing conclusions from data. Statistical science deals with data (Bina, 2020). Kalobo (2016) believes that the use of constructivist approaches and the application of inductive approaches in statistics education, the emphasis on statistical literacy, statistical reasoning, and thinking in statistics education can all improve statistics teaching and learning. According to delMas (2017), using statistical literacy, reasoning, and thinking to identify desired learning outcomes in statistics can be very helpful both when considering teaching objectives and when developing assessment tasks.

### **Students' Perceptions of Statistics**

According to Bond et al. (2012), perception is the result of an interplay between cognitive and non-cognitive elements. According to Gregory (1970), this idea is a productive process that draws on prior knowledge and experience and is also in charge of organizing, interpreting, looking for meaning, or trying to make

1 sense of a situation. According to Chiesi and Primi (2010), students start beginning  
 2 classes at varying degrees of proficiency, particularly in mathematics. In every  
 3 statistics lesson, students' verbal statistical reasoning and numeracy abilities are  
 4 frequently put to the test and pushed. In his 1991 study, Zeidner examined  
 5 students of social science who were anxious about statistics and mathematics. The  
 6 results revealed a negative correlation between students' final grade in  
 7 mathematics for grade 12 and their impression of themselves as mathematicians,  
 8 which in turn affected their performance. Provide an overview of the research area,  
 9 highlighting its relevance to educational practice and the increasing demand for  
 10 data literacy skills in various domains. Define key terms and concepts related to  
 11 student's perceptions of their engagement in Statistics Class activities. Clarify the  
 12 scope of the review, specifying the educational levels (e.g., primary, secondary,  
 13 tertiary) and the specific aspects of statistics activities (e.g., data collection,  
 14 analysis, interpretation, application) that are under investigation.

### 15 16 **Factors Influencing Students' Perceptions**

17  
18 Identify and discuss the factors that have been found to influence students'  
 19 perceptions of statistics activities. These factors may include instructional  
 20 strategies, teacher support, curriculum design, technological tools, and individual  
 21 characteristics. analyse how these factors have been addressed in previous studies  
 22 and identify any gaps or inconsistencies in the findings. Perception is defined by  
 23 Bond et al. (2012) as an interaction between cognitive and non-cognitive factors.  
 24 Gregory (1970) defines this concept as a constructive process that relies on prior  
 25 knowledge and experience, also responsible for ordering, interpreting, searching  
 26 for meaning or making sense out of a situation. Students enter introductory classes  
 27 with different levels of competence, especially mathematical competence (Chiesi  
 28 & Primi, 2010). Their verbal statistical reasoning and numeracy skills are  
 29 constantly tested and challenged in any statistics class. Zeidner's (1991) study  
 30 looked at statistics and mathematics anxiety in Social Science students. The  
 31 findings showed that students' mathematics self-perception and their final grade  
 32 12 mathematics grades were negatively correlated with students' statistics anxiety,  
 33 and consequently their performance.

### 34 35 36 **The Theoretical Framework**

37  
38 The theoretical framework for the study is based on Fredricks, Blumenfeld,  
 39 and Paris (2004) Model of Engagement. This model of engagement focuses on the  
 40 cognitive, emotional, and behavioral aspects of students' active participation in  
 41 their learning experiences (Fredricks, Blumenfeld, and Paris (2004). Engagement  
 42 is a complex term that emphasises students' various patterns in motivation,  
 43 cognition, and behavior (Appleton et al., 2008; Baron & Corbin, 2012; Fredricks  
 44 et al., 2004; Phan & Ngu, 2014a; Sharma & Bhaumik, 2013). "Engaged learning  
 45 involves students participating in class and thinking about what they are doing"  
 46 (GAISE College Report ASA Revision Committee 2016, 18). This theory suggests

1 that students' perceptions of their engagement in statistics class activities are  
2 influenced by three dimensions of engagement: behavioral engagement, emotional  
3 engagement, and cognitive engagement (Fredricks, Blumenfeld, and Paris (2004)).  
4

### 5 **Behavioral Engagement**

6  
7 According to Fredricks et al. (2004), behavioral engagement refers to  
8 students' observable actions and participation in statistics activities. These statistics  
9 activities, include attending classes, contributing to discussions, completing  
10 assignments, and collaborating with peers. Behavioral engagement flourishes with  
11 routines, assignments, activities, and cues that help students know not only what is  
12 expected of them but is also conducive to learning overall. Students who are  
13 engaged in a learning process, are usually actively listening, and paying attention.  
14

### 15 **Emotional Engagement**

16  
17 The emotional engagement domain concerns questions regarding students'  
18 feelings of belonging or value to their teacher, their classroom, or their school  
19 (e.g., interest, boredom, happiness, sadness, anxiety) (Fredricks et al., 2004;  
20 Renninger & Bachrach, 2015). Furthermore, emotional engagement relates to  
21 students' affective experiences, such as interest, enjoyment, and motivation, which  
22 influence their attitudes toward statistics and intrinsic motivation to learn.  
23

### 24 **Cognitive Engagement**

25  
26 Cognitive engagement encompasses students' investment in learning,  
27 motivation, goal setting, relevance perception, effort, and self-regulated learning  
28 strategies (Pohl, 2020). In statistics, it involves mental investment, critical  
29 thinking, problem-solving, and metacognitive strategies. Promoting behavioral,  
30 emotional, and cognitive engagement is crucial for fostering active involvement,  
31 positive attitudes, and meaningful learning experiences in statistics education.  
32 Effective instructional strategies can optimize student engagement and  
33 achievement. Further research should continue refining approaches to maximize  
34 student engagement in statistics education.  
35  
36

## 37 **Research Methodology**

38  
39 This study will use a quantitative survey research design to investigate  
40 students' perceptions of their engagement in statistics class activities based on the  
41 Model of Engagement (Fredricks, Blumenfeld, & Paris, 2004).  
42

### 43 **Sample Selection**

44  
45 A diverse sample of 433 grade 12 students was selected to ensure  
46 representation across educational districts.

1 **Survey Development**

2

3 A survey questionnaire (See appendix A) is being conducted to measure grade  
4 12 students' engagement in statistics class activities, including self-reported levels  
5 of engagement, interest, and relevance.

6

7 **Data Collection**

8

9 A survey was administered to grade 12 students to ensure anonymity and  
10 confidentiality.

11

12

13

14 **Data Analysis**

15

16 This study uses quantitative methods to gain a comprehensive understanding  
17 of student perceptions of engagement in statistics class activities. Descriptive  
18 statistics were computed to summarize quantitative survey data, including  
19 measures of central tendency and variability. The categories and core of the  
20 question of students' engagement in Statistics activities are presented in Table 1.

21

22 *Table 1.* Categories and core of the question of students' engagement in Statistics activities

Categories	Core of question	Question
<i>Behavioral Engagement</i>	Students work without support; step-by-step demonstrations; make Statistics interesting; Statistics tasks can raise my confidence, attending classes, contributing to discussions, completing assignments, collaborating with peers, routines, assignments, activities, actively listening, and paying attention.	13, 16, 17, 18
<i>Cognitive Engagement</i>	Cognitive engagement refers to students' investment and interest in their learning, motivation to learn, goal setting, perception of the relevance of learning, effort directed toward learning, and use of self-regulated learning strategies (Pohl, 2020). It involved students asking questions; preferring to understand; the context of the problem; recognises when students fail to comprehend; the success of individual students; different ways of solving problems; marking their own work; prior knowledge; mark my classmates' work.	1, 3, 4, 7, 9, 11, 12, 15, 19

<i>Emotional Engagement</i>	The emotional engagement domain concerns questions regarding students' boredom, happiness, sadness, anxiety, students' interest, enjoyment, and motivation. The way students participate in discussions, what questions they ask, how they seek help, and how they express curiosity. Students take part in practical problems; involve in-class activities; practice time; understand concepts; participate during corrections (Fredricks et al., 2004).	2, 5, 6, 8, 10, 14

### Students' Involvement in Statistics Class Activities

5 In this section, the students' questionnaire (see Appendix A) was used to test  
6 students' involvement in Statistics class activities. The questionnaire uses a five-  
7 point Likert scale to assess the students' involvement. It should be noted that the  
8 Statistics questionnaire contained 19 items. Tables 2 to 5 present the responses to  
9 the questions. Since it was not clear how the subscale scores for the various  
10 subscales should be interpreted, it was decided to calculate the 95% confidence  
11 intervals (CIs) for the mean and to interpret the mean score in the context of both  
12 the lower and upper CIs. Consideration was also given to whether the lower and  
13 upper CIs were, respectively, below or above the theoretical midpoint for the  
14 range of the scores (that midpoint, on a scale from 1 to 5, being 3).

15

### Behavioral Engagement

16

17

18

19

20

21

Table 2. Behavioral Engagement

	<i>Minimum</i>	<i>Maximum</i>	<i>Median</i>	<i>Mean</i>	<i>95% CI for mean</i>	<i>Standard deviation</i>
Behavioral Engagement	1.3	5	3.71	3.58	0.0756	0.79

22

23

24

25

26

Figure 1 provides a summary of the behavioral engagement subscales examined in the study. It visually represents the different dimensions of behavioral engagement that were investigated.

1 *Figure 1. Behavioural Engagement Subscales*

2  
3

4 Table 2 and Figure 1 reveal a range of scores on the behavioral engagement  
5 subscale, with students scoring as low as 1.3 and as high as 5. However, the  
6 mean score, along with its confidence intervals of 3.50|3.58|3.66, indicates that  
7 students typically employed a behaviorist approach to their learning in Statistics.  
8 Specifically, in response to questions 16 (3.83|3.94|4.05), 17 (3.82|3.94|4.06), and  
9 18 (3.47|3.59|3.71), many participants indicated that their teachers usually  
10 demonstrate step-by-step processes to make Statistics interesting and use  
11 teaching methods that enhance students' confidence. These responses align with  
12 the literature on behavioral engagement, which emphasizes student attendance,  
13 active participation in discussions, completion of assignments, and collaboration  
14 with peers.

15 However, it is concerning that in response to question 13(2.73|2.86|2.99),  
16 some students expressed uncertainty about working without support during class  
17 activities in Statistics. Addressing this concern is important, as it is essential for  
18 students to develop independence and self-efficacy in their learning.

19 Overall, the findings suggest that while students generally exhibit a  
20 behaviorist approach and benefit from teachers' demonstrations and support,  
21 there is room for improvement in fostering students' confidence and self-reliance  
22 during class activities in Statistics. By addressing these concerns, educators can  
23 promote greater autonomy and engagement among students, leading to more  
24 effective and meaningful learning experiences.

25

26 **Cognitive Engagement**

27

28 Cognitively engaged students would be invested in their learning, would seek  
29 to go beyond the requirements, and would relish a challenge (Sesmiyanti, 2018).  
30 Table 3 indicates students' view of their involvement in statistics, measured against  
31 cognitive engagement.

32

33 *Table 3. Cognitive Engagement*

	<i>Minimum</i>	<i>Maximum</i>	<i>Median</i>	<i>Mean</i>	<i>95% CI for mean</i>	<i>Standard deviation</i>
Cognitive	1.8	5	3.33	3.34	0.0529	0.55

Figure 2 summarizes the cognitive engagement subscales, offering a visual overview of the dimensions explored in the study.

Figure 2. Cognitive Engagement Subscales

Table 3 and Figure 2 reveal varying cognitive engagement scores among students, ranging from 1.8 to 5. The mean and CIs of 3.29|3.34|3.39 indicate a level of uncertainty in their engagement. However, responses to specific questions, such as 3 (4.20|4.29|4.38), 4 (3.76|3.88|4.00), 7 (3.91|4.03|4.15), 15 (3.76|3.88|4.00) and 19 (3.39|3.54|3.65), show that many participants frequently ask questions, apply previous knowledge, collaborate with peers, and use diverse problem-solving approaches in Statistics class. These responses align with the literature on cognitive engagement, highlighting students' investment in understanding and applying statistical concepts. On the other hand, there are concerns raised by the responses to questions 1 (2.35|2.46|2.57), 9(2.54|2.69|2.84), 11 (3.18|3.31|3.44), and 12 (2.95|3.09|3.23), where students expressed uncertainty. This includes students not asking questions, teachers lacking an individualized approach, and limited use of diverse problem-solving methods in Statistics classes.

These findings emphasize the need for addressing these concerns, promoting active questioning, individualized instruction, and varied problem-solving approaches in Statistics education. By addressing these areas, educators can enhance students' cognitive engagement and improve their overall learning experience.

### Emotional Engagement

Table 4 offers insights into students' emotional engagement in Statistics classes, enhancing our understanding of their perceptions and experiences in this context.

Table 4. Learning Environment

	<i>Minimum</i>	<i>Maximum</i>	<i>Median</i>	<i>Mean</i>	<i>95% CI for mean</i>	<i>Standard deviation</i>
<i>Learning</i>	1.5	5	3.67	3.60	0.0609	0.64

Figure 3 visually represents students' emotional engagement in Statistics classes, presenting a comprehensive overview of their emotional experiences.

1 *Figure 3. Emotional Engagement*

2  
3  
4 It is obvious from Table 4 and Figure 3 that the learning environment scores  
5 ranged between 1.5 and 5, with a mean and CIs of 3.54|3.60|3.66, indicating that  
6 students usually benefit from a positive Statistics learning environment. In  
7 relation to the responses to questions 2 (3.58|3.69|3.80), 6 (3.96|4.07|4.18), 8  
8 (3.25|3.38|3.51), 10 (3.47|3.58|3.69) and 14 (3.66|3.79|3.92), it is notable that  
9 participants consistently expressed a high level of active involvement in their  
10 learning experiences. Across these questions, which pertain to their emotional  
11 engagement in Statistics class activities, most participants responded with  
12 "usually" to indicate their active involvement. This consistent pattern of  
13 responses, with scores ranging from 3.58 to 3.92, suggests that the participants  
14 perceive themselves as actively engaged in their learning process. Their  
15 consistent inclination towards active involvement indicates a positive disposition  
16 and a genuine commitment to their Statistics education.

### 17 18 19 **Interpretation and Discussion**

20  
21 The way students perceive and engage with statistics class activities is  
22 multifaceted, influenced by three distinct dimensions of engagement: behavioral,  
23 emotional, and cognitive engagement. Through a meticulous analysis of the  
24 responses collected from the questionnaire administered to the students, it  
25 becomes unmistakably clear that the majority of students who participated in this  
26 research are actively and fervently involved in statistics activities. Their active  
27 engagement stems primarily from their robust behavioral engagement, their deep  
28 cognitive engagement, and their genuine emotional engagement within the  
29 context of the statistics class.

30 However, it is important to recognize that within this student population, a  
31 subset of individuals displays uncertainty when it comes to fully embracing  
32 behavioral engagement during statistics class activities. This hesitance often  
33 originates from their longing for additional support and guidance throughout the  
34 learning process. These students yearn for a nurturing environment that  
35 encourages and assists them in actively participating in class activities.

36 Furthermore, there are still other students who grapple with uncertainty when  
37 it comes to employing cognitive engagement, particularly demonstrated by their  
38 reluctance to ask questions. These individuals, for various reasons, may feel

1 hesitant or apprehensive about seeking clarification or further exploring concepts.  
2 Consequently, this reticence can potentially impede their cognitive engagement  
3 within the statistics class, preventing them from fully grasping and mastering the  
4 subject matter.

5 It is essential for teachers to recognise and address these uncertainties,  
6 fostering an inclusive and supportive learning environment that caters to the  
7 diverse engagement needs of their students. By providing adequate support,  
8 guidance, and encouragement, teachers can help students overcome their  
9 hesitations, enabling them to actively participate, seek clarity, and fully engage in  
10 statistics class activities.

11 Drawing insights from the students' responses gathered through the  
12 questionnaire, it becomes evident that a significant majority of the students who  
13 participated in this research have experienced a considerable degree of emotional  
14 engagement. They have formed a meaningful connection and invested their  
15 emotions into the statistics class activities. This emotional engagement has likely  
16 played a significant role in their overall learning experience.

17 However, it is worth noting that amidst this majority, there remains a subset  
18 of students who harbor uncertainty when it comes to independently solving  
19 problems before their teachers demonstrate the problem-solving process. These  
20 students express a reluctance to engage in independent problem-solving, preferring  
21 to rely on their teachers' guidance and instruction. This hesitation may stem from a  
22 lack of confidence or a fear of making errors without proper guidance.

23 Addressing the needs of these students who exhibit uncertainty is crucial to  
24 fostering their cognitive engagement and self-efficacy. Teachers should strive to  
25 create a supportive and empowering environment that encourages students to  
26 gradually develop their problem-solving skills, providing them with the necessary  
27 scaffolding and guidance. By nurturing their confidence and gradually fostering  
28 independence, teachers can help these students overcome their uncertainties and  
29 actively engage in problem-solving activities.  
30

### 31 **Initiatives to be implemented to Enable Students' Engagement**

32  
33 To enable students' engagement in statistics class activities and address the  
34 uncertainties expressed by certain individuals, the implementation of various  
35 initiatives is essential. Here are some initiatives that teachers can consider:  
36

- 37 1. Differentiated instruction: Recognize the diverse needs and learning styles  
38 of students, and tailor instruction accordingly. Provide a range of activities  
39 and materials that cater to different levels of behavioral, emotional, and  
40 cognitive engagement.
- 41 2. Clear learning objectives: Clearly communicate the learning objectives and  
42 outcomes of the statistics class activities. This clarity helps students  
43 understand the purpose of their engagement and motivates them to actively  
44 participate.
- 45 3. Supportive learning environment: Foster a supportive and inclusive  
46 classroom atmosphere where students feel comfortable expressing their

- 1           uncertainties and seeking assistance. Encourage collaboration, peer  
2           support, and open communication among students.
- 3           4. Scaffolding techniques: Gradually guide students toward independent  
4           problem-solving by providing scaffolded support. Break down complex  
5           problems into smaller, manageable steps, and provide prompts, examples,  
6           and models to assist students in building their confidence and skills.
- 7           5. Encourage questions: Create a safe space for students to ask questions  
8           without fear of judgment or criticism. Emphasize the value of questioning  
9           as a crucial component of cognitive engagement and understanding.  
10          Respond to questions with patience and clarity, promoting an open  
11          dialogue.
- 12          6. Feedback and reflection: Provide timely and constructive feedback to  
13          students, highlighting their strengths and areas for improvement.  
14          Encourage self-reflection and self-assessment to enhance metacognitive  
15          awareness, empowering students to take ownership of their learning  
16          process.
- 17          7. Varied instructional strategies: Incorporate a variety of instructional  
18          strategies, such as hands-on activities, group discussions, real-world  
19          examples, and technology-based tools. This diversity appeals to different  
20          engagement styles and helps maintain student interest and active  
21          participation.
- 22          8. Personalised support: Identify students who require additional support and  
23          offer one-on-one assistance or targeted interventions. Provide extra  
24          resources, tutoring, or mentoring to help students overcome their  
25          uncertainties and enhance their engagement.
- 26          9. Celebrate progress and effort: Recognize and celebrate students' progress,  
27          effort, and achievements in statistics class activities. This positive  
28          reinforcement boosts motivation and encourages continued engagement  
29          and growth.
- 30          10. Ongoing reflection and adaptation: Regularly reflect on the effectiveness  
31          of the implemented initiatives and make necessary adjustments based on  
32          student feedback and observed outcomes. Flexibility and adaptability are  
33          key to continuously improving students' engagement in statistics class  
34          activities.

35  
36           By implementing these initiatives, teachers can create an engaging and  
37           supportive learning environment that caters to the diverse engagement needs of  
38           students. This holistic approach will empower students to actively participate, seek  
39           clarity, develop problem-solving skills, and fully engage in statistics class  
40           activities.

41  
42  
43  
44

### Conclusion

45           This study examined students' perceptions of engagement in statistics class  
46           activities, providing insights for educators, curriculum developers, and

1 policymakers to enhance statistics education. Students' engagement is influenced  
 2 by behavioral, emotional, and cognitive dimensions. Most students actively  
 3 engage in statistics activities, but some have uncertainties regarding behavioral  
 4 engagement and cognitive engagement, such as seeking support or asking  
 5 questions. Quantitative data analysis showed positive engagement levels, with  
 6 students valuing practical applications and perceiving the relevance of statistics  
 7 skills in real-world contexts. The study's implications include tailoring  
 8 instructional practices to enhance engagement and learning outcomes, refining  
 9 data literacy programs, and informing educational policies. However, limitations  
 10 in sample size and composition suggest the need for larger-scale studies with  
 11 diverse samples. Future research could explore longitudinal changes in students'  
 12 perceptions and evaluate the impact of specific instructional strategies.

13 In conclusion, understanding students' perceptions of engagement in statistics  
 14 class activities is crucial for improving statistics education. By incorporating their  
 15 perspectives, educators, curriculum developers, and policymakers can create a  
 16 more engaging and effective learning environment, equipping students with the  
 17 necessary skills for data-driven decision-making.

## 1 Appendix A. Student Questionnaire

No	Question	Rarely	Sometimes	Uncertain	Usually	Almost always
1	<i>I ask questions during Statistics lessons</i>	1	2	3	4	5
2	<i>I take part in discussions during Statistics lessons</i>	1	2	3	4	5
3	<i>I prefer to understand what I am doing in Statistics</i>	1	2	3	4	5
4	<i>My teacher exposes us to the context of the problem in Statistics tasks</i>	1	2	3	4	5
5	<i>I can think of solutions to practical problems before my teacher can show us how the problems are solved</i>	1	2	3	4	5
6	<i>I learn a great deal when I am involved in class activities during Statistics</i>	1	2	3	4	5
7	<i>My teacher recognises when students fail to comprehend during Statistics lessons</i>	1	2	3	4	5
8	<i>I need sufficient practice time during Statistics classes</i>	1	2	3	4	5
9	<i>My teacher focuses on the success of individual students rather than of the group in Statistics lessons</i>	1	2	3	4	5
10	<i>I have a basic understanding of concepts in Statistics</i>	1	2	3	4	5
11	<i>I use different ways of solving problems in Statistics</i>	1	2	3	4	5
12	<i>I do mark my own work in Statistics class</i>	1	2	3	4	5
13	<i>I work without support during classwork activities in Statistics</i>	1	2	3	4	5
14	<i>I participate in corrections in Statistics activities</i>	1	2	3	4	5
15	<i>I use the Mathematics knowledge obtained in Grades 8, 9, 10, and 11 in Statistics activities</i>	1	2	3	4	5
16	<i>I follow my Mathematics teacher's step-by-step demonstrations of how tasks are supposed to be done in Statistics</i>	1	2	3	4	5
17	<i>My teacher makes Statistics interesting</i>	1	2	3	4	5
18	<i>I am provided with statistics tasks that can raise my confidence</i>	1	2	3	4	5
19	<i>I do mark my classmates' work in Statistics class</i>	1	2	3	4	5
