

Visual Literacy Research Spectrum: Paradigm Expansion for the Field of Information

Following up with the call and presentation of “Visual Literacy for Library and Information Science Education” at the ATINER’s 2015 conference, the author presented a paradigm expansion in visual literacy research for the information field. ACRL Visual Literacy Competency Standards for Higher Education in 2011 and its 2022 the Framework for Visual Literacy in Higher Education have presented a pressing task for research in visual literacy for the information field. Developing and leading an interdisciplinary research of visual literacy will enhance and advance the research, education, and professional services of the information field in this visual information world. This proposed research paradigm expansion focuses expanding from text-based information research and its services to a whole paradigm expansion and shift of information research methodology changes, advancements, and embracement of interdisciplinary spectrum for research opportunities to establish a critical and social construction of knowledge by examining the encoding and decoding of meaning process in the visual information world. The researcher has been doing research in visual literacy since 1992 and teaching visual literacy for the information field since 1999. As past President of the International Visual Literacy Association and guest editor of the Journal of Visual Literacy in 2015, the authors shares her insights and experience of research results on visual literacy for the field of information with the readers. This article shows some examples of visual literacy research, research methods, and theoretical framework for the information field.

Keywords: *visual literacy, paradigm expansion, information research, meaning.*

Introduction

In the author’s article in 2023, it states that “the information field is in the midst of advances in technology, internet access, and the rise of the pervasive visual information world. Visual information flows freely in this flat world without boundaries or structures or in various/different shapes and formats (Ma, 2015). When text-based or textual information is visualized, the meaning of the information becomes the center of research. When meaning becomes elusive or a shared process/activity in working with visual information, the social construction of knowledge/meaning has become essential to a new research paradigm. Research methodologies need to focus on the encoding and decoding processes to allow the social construction of knowledge/meaning for visual information by communities of users, which is a key concept of this article and research endeavor. This social construction of meaning/knowledge is based on communities of readers/viewers/users/patrons who create meaning. When meaning is created and constructed/deconstructed by readers/viewers/users/patrons in a shared community, research methodologies and theoretical frameworks to study meaning construction are critical and essential to the success of such a research process. The proposed

1 paradigm shift focuses on the information nature shifted from textual information
2 to visual information. The paradigm expansion focuses on expanding existing
3 research methodologies and theoretical frameworks to support this paradigm shift.
4 The paradigm inclusion invites interdisciplinary research and embraces diverse
5 research methodologies and theoretical frameworks to study visual information.
6 This paradigm shift, expansion, and inclusion empathize with the social
7 construction of knowledge/meaning in the studies of visual information by
8 communities of users.

9 Why is visual literacy in the information field? Information in visual form or
10 visual information requires and invites users'/viewers' interpretation and
11 interaction. This is a paradigm shift. Interaction with textual information is
12 different from that with visual information. Meaning construction then becomes
13 essential in visual information research. This article addresses the meaning and
14 construction of visual information and presents examples of visual literacy
15 research for the information field. Some key definitions of concepts are helpful for
16 readers of different disciplines to understand the content.

19 **What is the Information Field?**

21 “Information science is that discipline that investigates the properties and
22 behavior of information, the forces governing the flow of information, and the
23 means of processing information for optimum accessibility and usability. It is
24 concerned with the body of knowledge relating to the origination, collection,
25 organization, storage, retrieval, interpretation, transmission, and utilization of
26 information.” Borko, H. (Borko, 1968, p. 3).

27 “... information science brings together and uses the theories, principles,
28 techniques and technologies of a variety of disciplines toward the solution of
29 information problems. Among the disciplines brought together in this amalgam
30 called information science are computer sciences, cognitive science, psychology,
31 mathematics, logic, information theory, electronics, communications, linguistics,
32 economics, classification science, systems science, library science and
33 management science. They are brought to bear in solving the problems with
34 information — its generation, organization, representation, processing, distribution,
35 communication and use.” (Williams, 1987/1988, p. 17).

36 “Information science is the science and practice dealing with the effective
37 collection, storage, retrieval, and use of information. It is concerned with
38 recordable information and knowledge, and the technologies and related services
39 that facilitate their management and use. More specifically, information science is
40 a field of professional practice and scientific inquiry addressing the effective
41 communication of information and information objects, particularly knowledge
42 records, among humans in the context of social, organizational, and individual
43 need for and use of information. The domain of information science is the
44 transmission of the universe of human knowledge in recorded form, centering on
45 manipulation (representation, organization, and retrieval) of information, rather
46 than knowing information.” (Saracevic, 2009, p. 2570). (The Association for

1 Information Science and Technology (ASIS&T). 2023, September 30. *What is*
2 *Information Science*. P.1)

3 4 5 **What is Information?**

6
7 The field of information is an interdisciplinary study with theories and
8 practice. It is acknowledged that there are various definitions of information
9 throughout the history. Here are just a couple of the definitions to show the
10 challenging nature of defining information. Identify three principal uses of the
11 word INFORMATION:

12
13 Information-as-process ...
14 Information-as-knowledge ...
15 Information-as-thing ...
16 Buckland, Michael. (Buckland,1991, p.3).

17
18 Four traditions in definition of information:

- 19
20 – information as a resource
21 – information as a commodity
22 – information as perception of patterns
23 – information as a constitutive force in society
24 (Braman, 1989, p. 233)
25
26

27 **What is Visual Information?**

28
29 By these definitions and many other definitions of information throughout the
30 history for the information field, it is equally to define visual information. The
31 author defines visual information is part and type of information. Visual
32 information is information that is transmitted through a visual communication
33 medium. Visual information is encoded with messages by the author/designer/
34 producer. The users/viewers decode the intended message and create meaning
35 while they interact with the visual information. Medium carries messages, and
36 medium is not neutral.
37
38

39 **What is Information Literacy?**

40
41 According to the Association of College and Research Libraries, information
42 literacy is defined as “The set of skills needed to find, retrieve, analyze, and use
43 information. Information literacy is more closely tied to course-integrated instruction
44 but it extends far beyond coordination between the reference librarian and the
45 individual faculty member. Even a cursory review of the Information Literacy
46 Competency Standards (link) will show that there is much more to information
47 literacy competence than library-related research. Students must demonstrate

1 competencies in formulating research questions and in their ability to use
2 information as well as an understanding of ethical and legal issues surrounding
3 information. This requires a campus culture of collaboration and focus on student
4 learning. (Association of College and Research Libraries. September 29, 2023.
5 *Information Literacy Glossary*)
6
7

8 **What is Visual Information Literacy?**

9

10 Based on the Association of College and Research Libraries' definition of
11 information literacy, the author defines visual information literacy is a set of
12 abilities requiring individuals to recognize when visual information is needed and
13 have the ability to find, retrieve, evaluate, and use effectively the needed visual
14 information. However, visual information is different from textual information or
15 information in text form. Individuals need to have visual literacy education in
16 order to read, understand, interpret, and create visual messages. In order to study
17 visual information literacy, visual literacy is an essential part of the process.
18
19

20 **Visual Literacy and Information Literacy**

21

22 ACRL provides the description of Visual Literacy and Information Literacy
23 as stated "The *Visual Literacy Standards* were developed in the context of the
24 *Information Literacy Competency Standards for Higher Education*, and are
25 intended to complement the *Information Literacy Standards*. The *Visual Literacy*
26 *Standards* address some of the unique issues presented by visual materials. Images
27 often function as information, but they are also aesthetic and creative objects that
28 require additional levels of interpretation and analysis. Finding visual materials in
29 text-based environments requires specific types of research skills. The use, sharing,
30 and reproduction of visual materials also raise particular ethical and legal
31 considerations. The Standards address these distinct characteristics of images and
32 visual media and challenge students to develop a combination of abilities related to
33 information literacy, visual communication, interpretation, and technology and
34 digital media use. (Association of College and Research Libraries. September 30,
35 2023. *Visual literacy Competency Standards for Higher Education*).
36
37

38 **What is Visual Literacy?**

39

40 In the 60s, visual literacy started to be the focus for scholars to define it. John
41 Debes' offered the following definition of the term:
42

43 "Visual Literacy refers to a group of vision-competencies a human being can develop
44 by seeing and at the same time having and integrating other sensory experiences. The
45 development of these competencies is fundamental to normal human learning. When
46 developed, they enable a visually literate person to discriminate and interpret the
47 visible actions, objects, and symbols, natural or man-made, that he encounters in his

1 environment. Through the creative use of these competencies, he is able to
2 communicate with others. Through the appreciative use of these competencies, he is
3 able to comprehend and enjoy the masterworks of visual communication." (Debe,
4 1969). It is acknowledged that there are different definitions of visual literacy.
5
6

7 **Research Design & Methodology** 8 **Theoretical Background** 9

10 This article is a presentation of research methodologies and different
11 theoretical frameworks used to study visual literacy for the field of information.
12
13

14 **Visual Literacy Research for the Information Field** 15

16 There is little literature on visual literacy research for the information field to
17 study the meaning construction of visual information. Expanding from traditional
18 research methods and applying current research methods, visual literacy research
19 requires interdisciplinary approaches, theoretical frameworks, and the encoding
20 and decoding processes to design research approaches, research questions, and
21 analyze visual messages. In the following research publication examples, each
22 research statement or summary of research experience is based on completed
23 research studies. The author shares some examples with readers by asking research
24 questions, research models, and publications. These sample research studies invite
25 more visual literacy research effort and studies in visual literacy for the field of
26 information.
27

28 *Presentation of Research Studies in Visual Literacy for the Field of Information* 29

30 What happens when information is presented in a visual form with encoded
31 messages?

32 What critical questions can be asked for research?

33 The following visuals and visual texts in Figure 1 and Figure 2 are used as
34 examples for research of icons used as index pointers for information storage and
35 retrieval on the web. They illustrate the encoding process of the visual texts.

36 Sample research questions were from the published articles on visual literacy
37 research of information storage and retrieval studies are provided with references.
38
39

1 **Figure 1. *Icons on the Internet***

2
3 (November 22, 2022. Google.com)

4
5 Sample Research Questions:

6 What does this icon mean?

7 What is the original domain of this icon?

8 What is the use of this icon on the internet for indexing or searching purposes?

9 How are the icons used to index resources on library homepages?

10 What are the codes embedded in the icons on the websites for indexing and retrieval?

11
12 This research presents that the Web allows users to interact with graphic
13 interface to search information in a hypermedia/multimedia environment.
14 Graphics including color lines serve as indexes or reference points on the World
15 Wide Web for searching and retrieving information including texts, visuals, and
16 sound materials in a non-linear fashion. This study examines the codes embedded
17 in the icons on library homepages of Webs. Icons in this study refer to iconic
18 indexual signs. Codes are syntax patterns that are culturally constructed. They
19 have paradigmatic meanings.

20
21 **Figure 2. *Icons on the Internet***

22
23 (November 28, 2022. Google.com)

24
25 Sample Research Questions:

26 What does this icon mean?

27 What is the original domain of this icon?

28 What is the use of this icon on the internet for indexing or searching purposes?

29 How are the icons used to index resources on library homepages?

30 What are the codes embedded in the icons on the websites for indexing and retrieval?

31
32 This this research, the authors compared the traditional indexing principles
33 with the structures of icons.

34

1 **Figure 3. Film**

2
3 Wikipedia. (2022, December 18th.) *Crouching Tiger and Hidden Dragon*
4 https://en.wikipedia.org/wiki/Crouching_Tiger,_Hidden_Dragon

5
6 Sample Research Questions:
7 How does this movie position its viewers?
8 What are the cultural codes in this film?

9
10 This research provides an analysis of how a visual text (CTHD) positions the
11 viewer and creates its own subjectivity. It examines how community of viewers
12 creates meaning while they interact with the visual text.

13
14 **Figure 4. Website Design and Postmodern Art**

15
16 (Galter Health Sciences Library and Learning Center. September 30, 2022. <https://galter.northwestern.edu/>)
17

18
19 Two research studies applied reader-response criticism to examine postmodern
20 art and website design. The first research applies reader-response theory to
21 investigate subject positions of gender, age, race, and profession through a
22 poststructural analysis of a postmodern Chinese art work. It studies the relationship
23 between and among viewers, artist, and the visual text. It applies textual analysis,
24 survey, and interviews.

1 Sample Research Questions for the study are:

2

3 What are the codes that invite readers to read the fake Chinese characters?

4 How are viewers positioned by the artwork?

5 What meanings are constructed when viewers interact with the visual text?

6

7 In 2002, the author expanded the research methods and reader-response
8 criticism to study website design in the Galter Health Sciences Library. This study
9 examines the relationship between and among designers, text, and users of the
10 Galter Health Sciences Library Web site. It asks such questions as “How do Web
11 site designers construct their subject?” or, “Whom do the web designers think their
12 users are?” The study ascertains the intentions of the designers of the GHSL Web
13 site; examines the meanings made by the users through interviews; compares the
14 similarities and differences of designers’ intentions with their organization of
15 knowledge represented in the GHSL Web site; and compares the similarities and
16 differences between the designers’ intentions and views of the users.

17

22
23
24
25

This research addresses and shares with the library and information professionals the importance and process of meaning construction in data visualization. It is a critical study to analyze how meaning is construction in data visualization to provide insights for the information profession in data visualization for design purposes to understand the users better and serve them well in the global digital data age.

26
27

The examples mentioned above presented the encoding process by the authors/artists/designers/film directors.

28
29
30
31

Encoding means precisely that --selecting the codes which assign meanings to events, placing events in a referential context that attributes meaning to them (fictional codes perform this work too; it is not limited to the codes of "actuality" and naturalism). (Hall, 1973).

32
33
34

In the field of library and information science, encoding refers to the information storage process where meanings are assigned. Encoding means assigning codes to metadata in the organization of information, subject analysis,

1 data structure, database design, interface design, information systems, and in the
2 process of information storage.

3 Encoding is practiced at the time books/recourses are selected, recommended,
4 collection management, assignment metadata to visual texts. The author has
5 focused on the research examples on decoding more that encoding in this article.

6 Decoding is defined as meaning which is decoded by the receiver. For a
7 visual text, one needs to be taught and guided to learn how to decode visuals
8 correctly. One aspect of visual literacy is the skill of interpreting and creating
9 meaning from the stimuli that surround them. In the field of library and
10 information science, decoding is defined as the process of information retrieval.
11 The user/patron formulates information retrieval strategies to search for information
12 either by him/herself or with the assistance of an intermediary information
13 professional. The decoding process is usually assisted by reference information
14 professionals, and it happens with a reference interview.

15 These sample research studies presented above demonstrate how research in
16 visual literacy is carried. The author invites more research studies to continue and
17 expand visual literacy research in the field of information.
18

19 **Conclusion**

20
21
22 Information field is a professional practical field. Visual information has
23 challenged the profession on how to carry out research on visual information. This
24 is fundamentally a paradigm shift. The expanded research methods and
25 interdisciplinary theoretical frameworks introduced in this article strengthen the
26 traditional and current research methods and theoretical frameworks for the
27 research in information field. With the illustrated research examples of visual
28 literacy studies, it is hoped that more visual literacy research will be carried out in
29 the information field. The research will be in the encoding process and decoding
30 process to fully understand the visual texts. How will artificial intelligence assist or
31 resist original research to embrace new/different research methods and appropriate
32 theoretical frameworks to study visual literacy for the information field will be the
33 new endeavor for researchers.
