

# Breaking the Digital Breach: Preserving Tamil Heritage Through Structured, AI-Enhanced Literacy

*This paper introduces miABCTamil, a design-based educational application developed to address the structural gap — here termed the digital breach — between the interaction architectures of contemporary digital platforms and the cognitive demands required for deep heritage language literacy. Defined formally, the digital breach denotes the mismatch between design environments that privilege rapid stimulus-response engagement and the sustained interpretive processing that meaningful linguistic transmission requires. For classical heritage languages such as Tamil, which carries over two millennia of uninterrupted literary tradition, this breach is acutely consequential. miABCTamil comprises ten systematically sequenced modules — Tamil Alphabet, Tamil Sounds, Colors, Math, Festivals, Write, Words, Complete, Figures, and I Can Read in Tamil — designed to build literacy from foundational phonological encoding through to integrated cultural comprehension. A dedicated Words module enables dynamic, personalized vocabulary development, while a Festivals module anchors language acquisition within the lived cultural practices of Tamil Nadu. The application is designed to integrate seamlessly with its companion platform, miabc.online, enabling educators and parents to input custom texts that are processed through a Bloom's Taxonomy-based scaffolding architecture, generating comprehension questions across multiple cognitive levels. Grounded in levels-of-processing theory ( Craik & Lockhart, 1972), Vygotsky's Zone of Proximal Development (1978), and heritage language acquisition research (Montrul, 2016; Cummins, 1979), this paper argues that cognitive depth in digital learning environments depends on intentional architectural design rather than technological affordance alone. A six-stage cognitive model — Activate, Decode, Interpret, Reflect, Repair, Integrate — is proposed as a transferable framework for heritage literacy pedagogy. The paper further introduces the concept of digital classicism: the deliberate structuring of digital environments to preserve the interpretive depth and reflective rigor of classical linguistic traditions. As a design-based research contribution (McKenney & Reeves, 2019), this paper presents the theoretical and architectural rationale of miABCTamil, discusses implications for heritage language education globally, and identifies directions for future empirical validation.*

## Introduction

### *The Digital Breach: A Formal Definition*

The rapid proliferation of digital learning environments has transformed how young learners encounter language. Educational platforms have multiplied, and access to instructional content has expanded dramatically across demographic and geographic boundaries. Yet quantity of access does not guarantee quality of

1 cognitive engagement. As Gee (2003) observes in his analysis of digital learning  
2 architectures, the dominant design logic of interactive media tends to privilege  
3 immediacy, reward cycles, and surface-level stimulus-response patterns over the  
4 slower, more deliberate processes that sustain deep comprehension.

5 In this paper, the term *digital breach* — introduced as an original theoretical  
6 construct — denotes the structural gap between the cognitive demands required for  
7 deep linguistic comprehension and the interaction patterns commonly reinforced by  
8 digital media. The breach is not a product of technology per se; it emerges from  
9 design architectures that privilege immediacy over reflection, recognition over  
10 interpretation, and engagement metrics over epistemic depth (Prensky, 2001;  
11 Spolsky, 2004). It is an architectural problem, and it therefore requires an  
12 architectural solution.

13 For heritage languages — particularly those carrying classical literary traditions  
14 — this breach is especially consequential. Languages such as Tamil do not merely  
15 encode meaning; they transmit a way of knowing, a cognitive orientation shaped by  
16 millennia of poetic, philosophical, and religious discourse. When digital platforms  
17 fail to scaffold the interpretive processes that such traditions demand, heritage  
18 language learning risks becoming superficial performance rather than genuine  
19 acquisition.

### 20 21 *Heritage Languages in Digital Contexts*

22  
23 Tamil stands as one of the world's oldest continuously spoken and written  
24 languages, with a documented literary tradition extending over 2,000 years.  
25 Recognized by UNESCO (2003) as a Classical Language, Tamil has maintained its  
26 structural integrity across millennia while continuing to evolve as a living medium  
27 of governance, education, literature, and daily communication. It is spoken by over  
28 75 million people across Tamil Nadu, Sri Lanka, Singapore, Malaysia, and diasporic  
29 communities worldwide.

30 Heritage language learners, particularly those in diasporic communities,  
31 commonly experience fragmented exposure to their ancestral languages. Research  
32 on heritage language acquisition (Montrul, 2016; Cummins, 1979) consistently  
33 demonstrates that maintaining linguistic competence requires structured,  
34 meaningful engagement rather than incidental exposure alone. As Baker (2011)  
35 argues in his foundational treatment of bilingual education, language maintenance  
36 depends not only on input quantity but on the cognitive and affective quality of that  
37 input. Similarly, Byram (1997) emphasizes that effective language education must  
38 embed cultural meaning within linguistic instruction — that language and culture  
39 are not separable domains but constitutive of one another.

40 This inseparability of language and culture is not merely a theoretical claim; it  
41 is borne out in the institutional practice of heritage language communities  
42 worldwide. Zoupa and Karlis (2025), in their study of the Hellenic School of Ottawa  
43 — a Heritage Language School (HLS) operated by the Greek-Canadian diaspora —  
44 found that effective HLS programs combine formal language instruction with  
45 cultural activities including festivals, history, geography, and the arts, precisely  
46 because administrators and educators recognize that ethnic identity and linguistic

1 competence cannot be cultivated independently. Their research also identifies  
2 critical sustainability challenges facing such schools: limited resources, narrow  
3 digital integration, and difficulties sustaining community engagement across  
4 generations. These findings affirm both the urgency of the design problem that  
5 miABCTamil addresses and the institutional precedent for embedding cultural  
6 content within heritage language curricula.

7 As digital-native generations increasingly encounter Tamil through screens  
8 rather than community immersion, the central design question becomes: How can  
9 digital platforms be architected to support the deep cognitive engagement that  
10 heritage language transmission demands, while preserving the linguistic and  
11 cultural integrity of the tradition itself? This paper introduces miABCTamil as a  
12 principled, design-based response to that question.

## 15 **Theoretical Framework**

17 The design architecture of miABCTamil is grounded in four interconnected  
18 bodies of theory: levels-of-processing cognitive psychology, Vygotskian  
19 scaffolding, Bloom's Taxonomy of educational objectives, and heritage language  
20 acquisition research. This section develops each framework and articulates its  
21 application to the platform's design logic.

### 23 *Levels of Processing*

25 Craik and Lockhart's (1972) levels-of-processing framework proposed that  
26 memory retention is a function of depth of encoding rather than mere repetition.  
27 Shallow processing — such as graphemic recognition or surface-level matching —  
28 produces weak, transient memory traces. Semantic and interpretive processing, by  
29 contrast, produces more durable and retrievable representations. This foundational  
30 insight challenged the prevailing rehearsal-based models of memory and directed  
31 attention toward the qualitative character of cognitive engagement.

32 Subsequent research has refined and partially contested this framework.  
33 Baddeley (1986) demonstrated that working memory capacity and the phonological  
34 loop play crucial roles in initial encoding, complicating any simple hierarchy of  
35 processing depth. Perfetti and Hart (2002), in developing their lexical quality  
36 hypothesis, argued that reading proficiency depends on the precision and  
37 redundancy of lexical representations, suggesting that orthographic, phonological,  
38 and semantic processing must be integrated rather than sequentially staged. These  
39 refinements do not undermine the levels-of-processing insight; rather, they enrich it  
40 by specifying the mechanisms through which depth is achieved.

41 Applied to digital literacy design, this framework suggests that interaction  
42 architectures which encourage elaboration, inference, and reflection will support  
43 stronger encoding than architectures that emphasize rapid response cycles.  
44 miABCTamil operationalizes this principle by embedding tasks that require  
45 semantic interpretation and reflective engagement at every stage of the learning  
46 sequence.

### 1 *Scaffolding and the Zone of Proximal Development*

2  
3 Vygotsky (1978) introduced the Zone of Proximal Development (ZPD) as the  
4 conceptual space between a learner's current independent capability and the higher-  
5 level performance they can achieve with guided support. Effective instruction, on  
6 this account, is not instruction pitched at what a learner already knows, but rather  
7 support calibrated to the learning edge — challenging enough to extend capability,  
8 structured enough to prevent failure.

9 The concept of scaffolding as a pedagogical practice was operationalized by  
10 Wood, Bruner, and Ross (1976), whose study of adult-child problem-solving  
11 interactions identified six core functions of effective tutoring: recruiting interest,  
12 reducing the degrees of freedom, maintaining direction, marking critical features,  
13 controlling frustration, and demonstrating. These functions map directly onto the  
14 design requirements of effective educational software: a platform must recruit  
15 motivation, structure complexity, maintain task orientation, highlight salient  
16 features of the target language, support productive struggle, and model fluent  
17 performance.

18 Digital environments can replicate many aspects of scaffolding when they  
19 activate prior knowledge, provide graduated support, offer corrective feedback, and  
20 progressively reduce assistance as competence grows (Mayer, 2009; Sweller, 1988).  
21 miABCTamil's six-stage learning architecture — detailed in Section 3 — reflects  
22 this scaffolded progression explicitly.

### 23 24 *Bloom's Taxonomy and Structured Comprehension*

25  
26 The revised version of Bloom's Taxonomy, as reformulated by Anderson and  
27 Krathwohl (2001), organizes cognitive processes along a developmental continuum:  
28 Remember, Understand, Apply, Analyze, Evaluate, Create. Unlike the original  
29 taxonomy (Bloom, 1956), which used noun categories, the revised framework  
30 employs action-verb formulations that more directly specify observable cognitive  
31 behaviors and thus better serve instructional design purposes.

32 The relevance of this taxonomy extends beyond traditional educational design  
33 to encompass the emerging landscape of AI-integrated learning. Bennett and  
34 Abusalem (2024), in their analysis of generative AI technologies and their  
35 implications for higher education, argue that learning outcomes must shift away  
36 from content memorization and recall — the lower registers of Bloom's hierarchy  
37 — toward the development of higher-order thinking skills such as critical analysis,  
38 evaluation, creativity, and problem solving. They observe that AI tools capable of  
39 generating surface-level responses at speed create a specific risk: that students and  
40 designers alike become satisfied with performance at precisely the level of cognitive  
41 engagement that Craik and Lockhart (1972) identified as insufficient for durable  
42 learning. For miABCTamil, this risk is architectural as much as individual: a  
43 platform that uses AI to generate only recall-level questions would reproduce the  
44 very passive consumption architecture it is designed to disrupt. The Bloom's  
45 Taxonomy-based scaffolding of miabc.online directly addresses this concern,

1 ensuring that AI-generated questions span the full cognitive hierarchy from  
2 Remember through Create.

3 In miABCTamil, comprehension questions generated through integration with  
4 miabc.online are structured to span multiple levels of this taxonomy. A learner  
5 engaging with a text about Pongal, for example, may first be asked to identify the  
6 name of the festival (Remember), then to explain its agricultural significance  
7 (Understand), then to connect it to a family ritual they know (Apply), then to  
8 compare it with another seasonal celebration (Analyze). This graduated scaffolding  
9 ensures that language encounters are not reduced to surface-level recognition but  
10 are extended through progressively more demanding cognitive operations.

11 The taxonomy serves not as a rigid classification instrument but as a structural  
12 guide to ensure cognitive variety and developmental progression in the learning  
13 sequence.

### 14 *Heritage Language Acquisition*

15  
16  
17 Heritage language research (Montrul, 2016; Cummins, 2000) establishes that  
18 structured literacy experiences play a critical role in maintaining proficiency and  
19 sustaining identity alignment in diasporic learners. The challenge facing heritage  
20 language education is not simply linguistic: it is simultaneously cognitive, affective,  
21 and cultural. Learners must develop phonological and orthographic competence, but  
22 they must do so within a context that makes the language feel meaningful, owned,  
23 and alive.

24 Cummins' (1979) linguistic interdependence hypothesis offers an important  
25 theoretical resource here: it proposes that the literacy skills and conceptual  
26 knowledge developed in one language transfer to and support acquisition in a  
27 second language, provided the learner's first language is sufficiently developed. This  
28 principle underwrites the bilingual architecture of miABCTamil, which uses  
29 English as a bridge language to Tamil acquisition rather than positioning the two  
30 languages in competition.

31 Byram's (1997) framework of intercultural communicative competence further  
32 informs the platform's cultural embedding strategy. For Byram, language education  
33 is inadequate if it develops linguistic accuracy without cultivating the interpretive  
34 frameworks needed to navigate cultural meaning. miABCTamil integrates cultural  
35 content — festivals, family structures, traditional arts, moral narratives — not as  
36 supplementary enrichment but as constitutive of the language-learning experience  
37 itself.

## 38 39 40 **The miABCTamil Model: Design Architecture**

### 41 42 *System Overview: Ten Modules*

43  
44 miABCTamil comprises ten modules designed to build progressively  
45 structured Tamil-English bilingual literacy. The modules are sequenced to move

1 from foundational encoding systems through vocabulary development and cultural  
 2 embedding to integrated comprehension and independent reading.  
 3

Module	Focus	Primary Skill Domain
1. Tamil Alphabet	All 12 vowels, 18 consonants, and compound letters	Phonological & orthographic encoding
2. Tamil Sounds	Syllable patterns; special Tamil phonemes (zh, l, r, n)	Phonemic awareness & articulation
3. Colors	Color vocabulary with cultural and festival significance	Semantic vocabulary
4. Math	Tamil and English numbers; traditional counting systems	Numeracy & bilingual vocabulary
5. Figures	Geometric shapes; Kolam pattern introduction	Spatial reasoning & cultural art
6. Festivals	Top Tamil Nadu festivals with foods, clothing, and customs	Cultural literacy & identity
7. Write	Letter formation; guided writing practice	Orthographic production
8. Words	Dynamic vocabulary management; custom word addition	Lexical development
9. Complete	Syllable and word completion exercises	Phonological processing
10. I Can Read in Tamil	Progressive Tamil cultural texts; AI-generated comprehension questions	Reading fluency & comprehension

4  
 5 *The Six-Stage Cognitive Architecture*

6  
 7 The central design innovation of miABCTamil is a six-stage learning flow —  
 8 *Activate, Decode, Interpret, Reflect, Repair, Integrate* — that operationalizes the  
 9 theoretical frameworks outlined in Section 2. Each stage serves a distinct cognitive  
 10 function, and together they constitute a scaffolded progression from prior  
 11 knowledge activation to consolidation and transfer.  
 12

Stage	Cognitive Function	Design Implementation	Theoretical Basis
1. Activate	Schema priming; background knowledge activation	Cultural image or question prompting prior knowledge of Tamil context	Vygotsky (1978); Craik & Lockhart (1972)
2. Decode	Phonological and orthographic processing	Letter-sound correspondence; syllable construction; native audio	Baddeley (1986); Perfetti & Hart (2002)
3. Interpret	Meaning construction; causal and	Vocabulary in cultural context; bilingual bridging	Cummins (1979); Byram (1997)

	contextual reasoning		
4. Reflect	Metacognitive monitoring of comprehension	Bloom-level comprehension questions; self-assessment prompts	Anderson & Krathwohl (2001); Bennett & Abusalem (2024)
5. Repair	Strategy-based correction of misunderstanding	Targeted feedback; guided re-reading; error analysis	Wood, Bruner & Ross (1976); Mayer (2009)
6. Integrate	Consolidation through connection and transfer	Cross-module links; personalized vocabulary; family engagement	Montrul (2016); Baker (2011); Zoupa & Karlis (2025)

1  
2 To illustrate: a lesson centered on Pongal — the Tamil harvest festival  
3 celebrated in January — begins by activating the learner's existing sensory and  
4 cultural knowledge (Stage 1). It then decodes the Tamil script of the festival's name  
5 and associated vocabulary (Stage 2). Through culturally situated sentences, the  
6 learner constructs meaning around harvest, gratitude, and community (Stage 3).  
7 Comprehension questions at the Understand and Apply levels prompt reflection on  
8 what has been encountered (Stage 4). Where misunderstandings occur, the platform  
9 provides targeted corrective feedback (Stage 5). Finally, the learner connects Pongal  
10 vocabulary to previously learned color and food words, and may add a family  
11 Pongal word to their personal Words module (Stage 6). This is not incidental  
12 language contact; it is architecturally structured linguistic transmission.

#### 13 14 *Cultural Embedding: The Festival Module*

15  
16 Rather than treating cultural content as supplementary enrichment,  
17 miABCTamil embeds cultural knowledge as a constitutive dimension of linguistic  
18 instruction. The Festivals module introduces learners to the ten major festivals of  
19 Tamil Nadu — Pongal, Thai Pusam, Karthigai Deepam, Aadi Perukku, Navarathri,  
20 and Karthigai among them — through the Tamil vocabulary of traditional foods,  
21 customary clothing, ritual practices, and seasonal significance.

22 This design choice reflects Byram's (1997) argument that intercultural  
23 competence requires not just linguistic accuracy but the interpretive frames through  
24 which cultural meanings are produced and received. A learner who can decode the  
25 letters of the word *Pongal* but does not know its significance — its connection to  
26 harvest, to the sun, to the ritual boiling of rice — has acquired a symbol without  
27 acquiring its referent. Cultural embedding ensures that Tamil script and Tamil  
28 meaning are encountered together.

29 The operational logic of this approach is corroborated by Zoupa and Karlis's  
30 (2025) findings on Heritage Language School administration. Their research  
31 demonstrates that the most effective HLS programs structure their curricula around  
32 precisely this integration: language instruction is delivered not as an isolated skills  
33 sequence but as a vehicle for cultural transmission, with festivals, historical  
34 narratives, and communal practices forming the core content through which  
35 linguistic competence is developed. miABCTamil translates this community-

1 validated principle into a digital architecture, making it scalable and accessible to  
2 Tamil learners far beyond the geographic reach of institutional heritage schools.

### 3 4 *AI Integration: Architecture and Oversight*

5  
6 Through integration with the companion web platform miabc.online, educators  
7 and parents can input custom Tamil or bilingual texts that are processed through a  
8 Bloom's Taxonomy-based question generation system. The AI system analyzes the  
9 semantic and structural features of the input text, classifies key concepts according  
10 to the cognitive levels of the revised taxonomy (Anderson & Krathwohl, 2001), and  
11 generates comprehension questions designed to engage learners from basic recall  
12 through higher-order reasoning.

13 The pedagogical design rationale for this integration draws on Mayer's (2009)  
14 principles of multimedia learning — specifically, the coherence and signaling  
15 principles, which hold that learning is enhanced when instructional content is  
16 organized around the learner's cognitive architecture rather than the content's own  
17 internal logic — and on Sweller's (1988) cognitive load theory, which cautions that  
18 instructional design must manage the total cognitive demand placed on working  
19 memory.

20 The deployment of AI question generation in miABCTamil is explicitly  
21 designed to address the concern raised by Bennett and Abusalem (2024) regarding  
22 the risk that AI technologies may produce responses that satisfy surface-level  
23 academic criteria while bypassing the deeper cognitive engagement necessary for  
24 genuine learning. Their analysis advocates for a systematic shift — grounded in  
25 Bloom's Taxonomy — away from AI use that automates lower-order recall toward  
26 AI architectures that scaffold higher-order thinking. The miabc.online integration  
27 embodies this principle: rather than using AI to generate closed, fact-based  
28 questions, the system is calibrated to produce questions that require inference,  
29 application, and evaluation. Human review of all generated questions before  
30 deployment provides a further check on quality and cultural appropriateness.

31 Human oversight is structurally embedded in this process: all AI-generated  
32 questions are reviewed by educators or parents before deployment. This review  
33 layer is not an optional safeguard but an integral component of the system design.  
34 Automated question generation carries known risks — particularly the risk of  
35 flattening cultural nuance, misclassifying culturally specific content, or generating  
36 questions that are technically valid but pedagogically inappropriate (Zheng, 2020).  
37 The review step ensures that the pedagogical integrity of the Tamil-English learning  
38 experience is maintained by human judgment informed by cultural knowledge.

## 39 40 41 **Passive Consumption versus Cognitive Scaffolding**

### 42 43 *The Architecture of Passive Digital Learning*

44  
45 The dominant design logic of contemporary educational applications — and of  
46 digital media more broadly — favors what might be called a *passive consumption*

1 *architecture*: a loop of stimulus, response, and reward in which the learner is  
 2 positioned as a receiver of information rather than a constructor of meaning.  
 3 Gamified feedback systems, progress badges, and streak counters are effective tools  
 4 for sustaining engagement, but engagement is not equivalent to learning (Gee,  
 5 2003). A learner can maintain perfect streaks in a language application while  
 6 processing its content at precisely the shallow level that Craik and Lockhart (1972)  
 7 identified as insufficient for durable encoding.

8 For heritage languages, this problem is especially acute. Tamil cannot be  
 9 adequately learned through surface-level matching and repetition, because Tamil  
 10 meaning is often inseparable from its cultural and contextual frame. The word *thaa*  
 11 (mother) carries not just its denotative meaning but a dense network of relational,  
 12 affective, and literary associations that only become accessible through sustained  
 13 interpretive engagement. An application that treats *thaa* as a vocabulary item to be  
 14 matched against an image has given the learner a fragment of a language without  
 15 giving them the language itself.

### 16 17 *Scaffolding as Intentional Friction*

18  
19 miABCTamil introduces what might be termed *intentional friction* into the  
 20 learning architecture: structured resistance to the passive consumption pattern. This  
 21 friction is not arbitrary difficulty but deliberate cognitive demand calibrated to the  
 22 learner's ZPD. Pre-reading activation questions require the learner to engage prior  
 23 knowledge before encountering new text. Multi-level comprehension questions  
 24 require analysis and evaluation rather than simple recall. Reflective prompts require  
 25 the learner to articulate their understanding in their own words. Guided re-reading  
 26 sequences prompt repair when comprehension breaks down.

27 Wood, Bruner, and Ross (1976) identified the management of frustration as a  
 28 central scaffolding function: effective support keeps the learner in productive  
 29 struggle — challenged but not overwhelmed. miABCTamil achieves this through  
 30 adaptive question difficulty, bilingual support structures that allow learners to access  
 31 meaning in English when Tamil processing stalls, and a repair stage that addresses  
 32 errors with explanation rather than mere correction.

33 The contrast between passive consumption and cognitive scaffolding is, at its  
 34 core, a design distinction rather than a technological one. Bennett and Abusalem  
 35 (2024) make a closely related observation in the context of AI and higher education:  
 36 the same generative technology can be deployed to automate cognitive work on  
 37 behalf of the learner — replacing thinking rather than scaffolding it — or it can be  
 38 structured to extend and deepen the learner's own cognitive engagement. The choice  
 39 is architectural. miABCTamil is designed so that AI tools serve the latter function:  
 40 generating questions that require the learner to do the cognitive work of recall,  
 41 inference, evaluation, and synthesis rather than passively receiving pre-packaged  
 42 answers.

43 The distinction between passive consumption and cognitive scaffolding is,  
 44 ultimately, architectural. It is not a question of whether a platform is entertaining or  
 45 serious, modern or traditional, but of whether its design structure produces shallow

1 processing or deep encoding. A well-designed platform can be both engaging and  
2 cognitively demanding. miABCTamil is designed to be both.

### 5 **Digital Classicism: A Proposed Framework**

7 This paper proposes the concept of *digital classicism* as an original theoretical  
8 framework for understanding and designing digital environments that serve heritage  
9 and classical language education. Digital classicism, as defined here, is the  
10 intentional structuring of digital interaction architectures to preserve the interpretive  
11 depth, reflective rigor, and cultural density that characterize classical linguistic  
12 traditions. It is not a rejection of digital media but a deliberate redesign of the  
13 interaction principles that govern how digital media structures cognition.

14 Classical languages — and Tamil exemplifies the type — are not merely  
15 repositories of vocabulary and grammar. They are cognitive environments: they  
16 carry within their structures specific ways of knowing, of organizing experience, of  
17 making and receiving meaning. Classical Tamil poetry operates through systems of  
18 *akam* (interior, erotic) and *puram* (exterior, heroic) that presuppose a reader capable  
19 of recognizing the conventions and generating the appropriate interpretive response.  
20 A digital platform that reduces classical Tamil to word-matching exercises does not  
21 merely fail to preserve the tradition; it actively teaches learners to encounter Tamil  
22 in a mode incompatible with that tradition's own cognitive demands.

23 Digital classicism proposes three design principles as responses to this problem.  
24 First, the *depth principle*: every learning interaction should require semantic  
25 processing rather than permitting surface-level response. Second, the *cultural*  
26 *embeddedness principle*: cultural meaning must be constitutive of linguistic  
27 instruction, not supplementary to it. Third, the *reflective architecture principle*: the  
28 design must structurally require pauses for metacognitive monitoring, interpretive  
29 effort, and consolidation. These principles are instantiated in miABCTamil's six-  
30 stage cognitive architecture and its cultural embedding strategy.

31 These principles are grounded not only in theoretical frameworks but in  
32 documented community practice. Zoupa and Karlis (2025) demonstrate that  
33 Heritage Language Schools which sustain strong cultural embedding — integrating  
34 festivals, community history, and traditional arts into the language curriculum —  
35 are precisely those that report stronger learner engagement and cultural identity  
36 outcomes. Digital classicism can be understood, in this light, as the architectural  
37 translation of proven HLS principles into scalable digital form: the depth principle  
38 corresponds to the deep linguistic instruction of effective HLS programs; the  
39 cultural embeddedness principle mirrors the inseparability of language and culture  
40 that administrators in Zoupa and Karlis's study consistently emphasize; and the  
41 reflective architecture principle addresses the gap in current digital tools identified  
42 by Bennett and Abusalem (2024), whose analysis calls for learning environments  
43 that structurally require higher-order cognitive engagement rather than leaving it to  
44 individual initiative.

45 Digital classicism, as a framework, is intended to be transferable beyond Tamil  
46 to other classical heritage languages — Sanskrit, Classical Arabic, Ancient Greek,

1 Classical Chinese — that face analogous pressures from digital-native learning  
 2 environments. The specific content and cultural context will necessarily vary; the  
 3 architectural principles apply across the type.

## 6 **Implications for Heritage Language Education**

### 8 *Transferability of the Scaffolding Architecture*

10 The six-stage cognitive architecture proposed in this paper — Activate,  
 11 Decode, Interpret, Reflect, Repair, Integrate — is a domain-general design  
 12 framework whose content is culturally specific but whose cognitive logic is  
 13 transferable. Any heritage language community seeking to develop digital literacy  
 14 tools faces the same core design problem: how to structure interaction so that deep  
 15 processing, not surface engagement, is the default cognitive mode. The  
 16 miABCTamil architecture offers one principled solution to that problem, grounded  
 17 in established learning theory and developed through iterative design practice.

18 Future work might examine the extent to which this architecture, stripped of its  
 19 Tamil-specific content, can be deployed as a template for other heritage language  
 20 platforms — and whether its cognitive scaffolding effects are robust across different  
 21 learner populations, age groups, and linguistic typologies.

### 23 *Bilingualism as Cognitive Resource*

25 miABCTamil treats bilingualism not as a problem to be managed but as a  
 26 cognitive resource to be leveraged. Cummins' (1979) linguistic interdependence  
 27 hypothesis provides the theoretical warrant: literacy skills transfer across languages  
 28 when the first language is sufficiently developed. English is used in miABCTamil  
 29 not to replace Tamil but to support access to Tamil meaning during the early stages  
 30 of acquisition, and progressively to recede as Tamil competence grows. This design  
 31 choice reflects the platform's commitment to additive bilingualism — the  
 32 enrichment of the learner's linguistic repertoire — rather than subtractive  
 33 bilingualism, which treats heritage language maintenance as a barrier to dominant  
 34 language acquisition (Baker, 2011).

### 36 *Family and Community Engagement*

38 Heritage language transmission is not solely a pedagogical problem; it is a  
 39 social and familial one. Montrul (2016) observes that the home domain is the  
 40 primary site of heritage language exposure for diasporic learners, and that parental  
 41 language use is among the strongest predictors of heritage language maintenance.  
 42 miABCTamil's architecture reflects this by building family engagement into the  
 43 platform's core functionality: family members can record their own voice  
 44 pronouncing Tamil words, add family-specific vocabulary to the Words module,  
 45 and access the platform's Family module to document family names and

1 relationships in Tamil. The platform is not merely a pedagogical tool; it is a family  
2 language resource.

3 This design commitment is reinforced by the evidence base on Heritage  
4 Language School practice. Zoupa and Karlis (2025) found that community and  
5 family involvement is among the most consistently cited success factors in HLS  
6 administration: schools that maintain active parent engagement, community cultural  
7 events, and intergenerational learning activities demonstrate stronger outcomes in  
8 both linguistic competence and cultural identity. Their study identifies the absence  
9 of such engagement as one of the primary weaknesses facing HLS programs — a  
10 weakness that miABCTamil's family-integrated architecture is specifically designed  
11 to address in the digital domain. By enabling family members to contribute voice  
12 recordings, add culturally specific vocabulary, and participate in the learner's  
13 progress, the platform extends the community engagement logic of effective  
14 heritage schools into a form that does not require physical proximity or institutional  
15 infrastructure.

## 16 17 18 **Limitations and Future Directions**

19  
20 This paper presents a design-based research contribution (McKenney &  
21 Reeves, 2019): it articulates the theoretical rationale and architectural logic of  
22 miABCTamil rather than reporting measured outcome data. This is a principled  
23 methodological choice appropriate to the current stage of the platform's  
24 development, but it carries significant limitations that must be acknowledged  
25 clearly.

26 No empirical data on learning outcomes, comprehension gains, or identity  
27 measures are reported in this paper. All claims regarding the platform's cognitive  
28 effects are design-intentional — they describe what the architecture is designed to  
29 produce — rather than evidential. The theoretical frameworks cited provide strong  
30 theoretical warrant for the design decisions, but warrant is not evidence. Future  
31 research must examine: (1) whether learners who use miABCTamil demonstrate  
32 measurably greater comprehension gains than learners using comparison platforms;  
33 (2) whether the platform's cultural embedding strategy produces stronger identity  
34 alignment with Tamil heritage over time; (3) whether the six-stage cognitive  
35 architecture generalizes across age groups, from early childhood through adult  
36 heritage learners; and (4) whether the AI-generated question quality holds up against  
37 expert teacher judgment in comparative validity studies.

38 Additionally, the current paper does not report usability testing data,  
39 accessibility evaluations, or teacher training outcomes. Each of these is a necessary  
40 component of a full design-based research program. The platform's integration with  
41 miabc.online introduces additional research questions around educator uptake, the  
42 quality of parent-reviewed AI-generated content, and the long-term sustainability of  
43 community engagement features.

44 The concept of digital classicism, introduced in Section 5, requires further  
45 theoretical elaboration and empirical operationalization. As an original coinage, it  
46 needs to be tested against cases, refined through critique, and situated more precisely

1 within adjacent scholarship on digital humanities, heritage linguistics, and  
 2 educational technology design. The framework proposed here is necessarily  
 3 preliminary.

4 These limitations are not dismissals of the contribution. A well-articulated  
 5 design framework grounded in established theory and developed through iterative  
 6 practice is a legitimate and necessary precursor to empirical investigation. This  
 7 paper establishes the theoretical and architectural foundation; the empirical program  
 8 it calls for is the work of subsequent phases.

## 11 Conclusion

13 Digital technologies do not inherently diminish heritage languages. The  
 14 problem is not the medium; it is the architecture. When digital platforms are  
 15 designed around the logic of passive consumption — rapid response, surface  
 16 engagement, reward cycles — they produce learners who can navigate the interface  
 17 but cannot inhabit the language. For a classical heritage language like Tamil, which  
 18 demands interpretive depth, cultural attunement, and reflective engagement, this  
 19 architectural failure is not a minor inconvenience. It is a mechanism of language  
 20 loss dressed in the clothing of language learning.

21 miABCTamil is a response to this architectural problem. By grounding its  
 22 design in levels-of-processing theory, Vygotskian scaffolding, Bloom's revised  
 23 taxonomy, and heritage language acquisition research, the platform constructs a  
 24 learning environment in which cognitive depth is the default mode rather than an  
 25 exceptional achievement. Its six-stage cognitive architecture — Activate, Decode,  
 26 Interpret, Reflect, Repair, Integrate — provides a transferable model for digital  
 27 heritage literacy design. Its cultural embedding strategy treats Tamil festivals,  
 28 family structures, and literary traditions not as decorative enrichment but as the  
 29 living content through which language meaning is constructed and transmitted.

30 The concept of digital classicism, proposed in this paper, offers a broader  
 31 theoretical frame for this work. Classical languages are not relics to be preserved in  
 32 digital amber. They are living cognitive traditions that demand living pedagogies —  
 33 pedagogies capable of harnessing the reach and interactivity of digital media while  
 34 refusing to surrender the interpretive depth that makes those traditions worth  
 35 transmitting. Technology, intentionally designed, can serve this purpose.  
 36 miABCTamil demonstrates how.

37 Tamil has survived for over two thousand years not because it was preserved  
 38 passively but because each generation found new forms through which to transmit  
 39 it with full cognitive and cultural intensity. Digital classicism is one such form for  
 40 the present generation. The ancient language of Thiruvalluvar belongs in the digital  
 41 age — but only on terms that honor the depth of the tradition it carries.
